FOREWORD

The American National Standards Committee B4 was organized in June 1920, and it developed the American Standard ASA B4a-1925, Tolerances, Allowances and Gages for Metal Fits.

As a result of committee work during World War II by ASA and ABC (American, British, Canadian), American Standard, Limits and Fits for Engineering and Manufacturing (Part I), ASA B4.1-1947, was produced. The preface to that document made significant reference to the contribution of the ABC meetings in developing agreement on five basic principles, four of which apply to the present standard. These related to the desirability of establishing common definitions, a table of preferred basic sizes, a system of preferred tolerances and allowances, and a uniform method of applying tolerances.

In 1973, the General Motors Corporation recognized a need for a metric standard similar to the ISO R286 and published an interim standard which was later adopted as an ANSI Special Metric Publication, SR 11.

The B4 Standards Committee was reorganized in November 1975, and renamed "Standardization of Allowances and Tolerances for Manufactured Parts". The first draft proposal of this standard was based on the principles noted above and utilized computer programs to implement the concept.

The preferred basic sizes have been selected from the American National Standard for Preferred Metric Sizes for Round, Square and Hexagonal Metal Products, B32.4-1974, and the first choice sizes are all consistently rounded off from the Renard 10 (R10) series of preferred numbers. A logical reduction or expansion of the first choice sizes can simply be achieved by utilizing the R5 or R20 series of preferred numbers as explained in this standard.

The selection of standard tolerance zones and preferred metric fits in this standard were based on international and national standards shown in the following list:

WORLD	ISO SYSTEM OF LIMITS AND FITS ISO/R286	PREFERRED TOLERANCE ZONES ISO 1829
USA	ANSI SR 11	ANSI B4.1 (INCH STD)
JAPAN	JIS B 0401	JIS B 0401
GERMANY	DIN 7160/61	DIN 7157/54/55
FRANCE	NF E 02-100-118	NF E 02-131-135
U.K.	BSI 4500	BSI 4500
ITALY	UNI 6388/89	UNI 7218
CANADA	NONE	CSA B97.3 (INCH STD)
AUSTRALIA	AS 1654	AS 1654

The above standards have affected the availability of material stock, tooling and gages to the preferred ISO tolerances throughout the world. Implementation of this standard by industry can greatly reduce cost in manufacturing.

A draft proposal was circulated for letter ballot of the B4 Committee on October 16, 1976. Comments received as a result of this ballot led to changes and subsequent approval of the text by the Committee. Final approval for this standard was granted by the American National Standards Institute (ANSI) on 8 March 1978.

ACKNOWLEDGMENT

Tables 2, 3, 4 and 5 of the text and Tables A1 through A24 of the Appendix were developed by Massey-Ferguson and full rights to usage have been conveyed to ASME.

AMERICAN NATIONAL STANDARDS COMMITTEE B4

Standardization of Allowances and Tolerances for Manufactured Parts

(The following is the roster of the Committee at the time of approval of this Standard)

OFFICERS

Knut O. Kverneland, *Chairman*
C. J. Gomez, *Secretary*

COMMITTEE PERSONNEL

AMERICAN MEASURING TOOL MANUFACTURERS ASSOCIATION
R. P. Knittel, Glastonbury Gage, REB Industries, Inc., Glastonbury, Connecticut

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, THE
A. E. Merritt, Harnischfeger Corporation, Milwaukee, Wisconsin
R. T. Woythal, Standard Machine Div., Kearney & Trecker Corporation, Milwaukee, Wisconsin

ANTI-FRICTION BEARING MANUFACTURERS ASSOCIATION, THE
K. D. MacKenzie, The Barden Corporation, Danbury, Connecticut

COMPUTERS AND BUSINESS EQUIPMENT MANUFACTURERS ASSOCIATION
A. E. Mall, International Business Machines Corporation, Endicott, New York

METAL CUTTING TOOL INSTITUTE
D. J. Emanuelli, Greenfield Tap & Die, A United-Greenfield Div. of TRW, Inc., Greenfield, Massachusetts

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION
F. V. Kupchak, Westinghouse Electric Corporation, R & D Center, Pittsburgh, Pennsylvania
R. L. Mancini, Alternate, National Electrical Manufacturers Association, New York, New York

NATIONAL FLUID POWER ASSOCIATION
J. R. Luecke, National Fluid Power Association, Milwaukee, Wisconsin

NATIONAL MACHINE TOOL BUILDERS ASSOCIATION
F. S. Blackall, III, The Taft-Peirce Manufacturing Company, Woonsocket, Rhode Island
W. L. McCann, Fond du Lac, Wisconsin

R. E. W. Harrison, Harrison Engineering Services, Washington, D.C.

A. O. Schmidt, University of Wisconsin, Milwaukee, Wisconsin

CONTENTS

AMERICAN NATIONAL STANDARD

PREFERRED METRIC LIMITS AND FITS

1. SCOPE

This standard describes the ISO system of limits and fits for mating parts as it is approved for general engineering usage in the United States of America. It establishes: (1) the designation symbols used to define specific dimensional limits on drawings, material stock, related tools, gages, etc., (2) the preferred basic sizes (first and second choices), (3) the preferred tolerance zones (first, second and third choices), (4) the preferred limits and fits for sizes (first choice only) up to and including 500 millimeters, and (5) definitions of related terms. Tolerance zones for basic sizes in the range from 500 to 3150 mm are specified in Appendix B.

The general terms "hole" and "shaft" can also be taken as referring to the space containing or contained by two parallel faces of any part, such as the width of a slot, the thickness of a key, etc.

2. DEFINITIONS

The most important terms relating to limits and fits are as shown in Figure 1. The terms are defined in words below:

(1) *Basic Size.* The size to which limits or deviations are assigned. The basic sizes is the same for both members of a fit. It is designated by the number 40 in 40H7.

(2) *Deviation.* The algebraic difference between a size and the corresponding basic size.

(3) *Upper Deviation.* The algebraical difference between the maximum limit of size and the corresponding basic size.

(4) *Lower Deviation.* The algebraic difference between the minimum limit of size and the corresponding basic size.

(5) *Fundamental Deviation.* That one of the two deviations closest to the basic size. It is designated by the letter H in 40H7.

(6) *Tolerance.* The difference between the maximum and minimum size limits on a part.

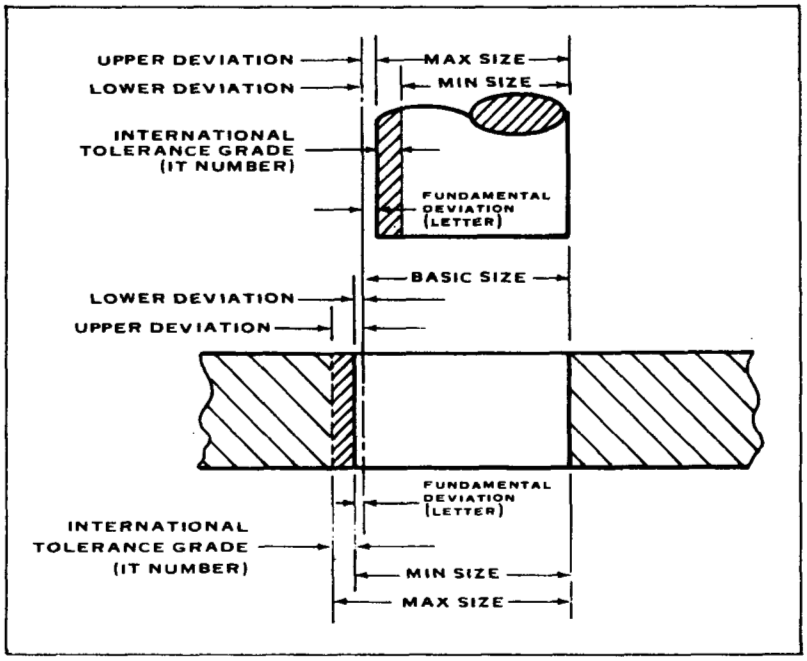

FIG. 1 ILLUSTRATION OF DEFINITIONS

(7) *Tolerance Zone.* A zone representing the tolerance and its position in relation to the basic size.

(8) *International Tolerance Grade (IT).* A group of tolerances which vary depending on the basic size, but which provide the same relative level of accuracy within a given grade. It is designated by the number 7 in 40H7 (IT7).

(9) *Hole Basis.* The system of fits where the minimum hole size is basic. The fundamental deviation for a hole basis system is "H".

(10) *Shaft Basis.* The system of fits where the maximum shaft size is basic. The fundamental deviation for a shaft basis system is "h".

(11) *Clearance Fit.* The relationship between assembled parts when clearance occurs under all tolerance conditions.

(12) *Interference Fit.* The relationship between assembled parts when interference occurs under all tolerance conditions.

(13) *Transition Fit.* The relationship between assembled parts when either a clearance or interference fit can result depending on the tolerance conditions of the mating parts.

3. DESCRIPTION OF TOLERANCE DESIGNATION

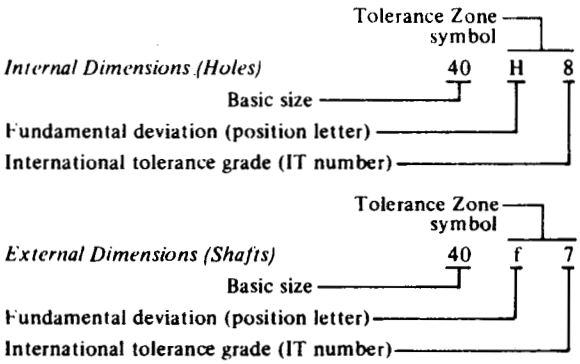
An "International Tolerance grade" establishes the magnitude of the tolerance zone or the amount of part size variation allowed for internal and external dimensions alike (see Figure 1). Tolerances are expressed in "grade numbers", which are consistant with International Tolerance grades identified by the prefix IT, i.e., "IT6", "IT11", etc. A smaller grade number provides a smaller tolerance zone (see Appendix B, Table B1).

A fundamental deviation establishes the position of the tolerance zone with respect to the basic size (see Figure 1). Fundamental deviations are expressed by "tolerance position letters". Capital letters are used for internal dimensions (see Appendix B, Table B2), and lower case or small letters are used for external dimensions (see Appendix B, Table B3).

4. SYMBOLS

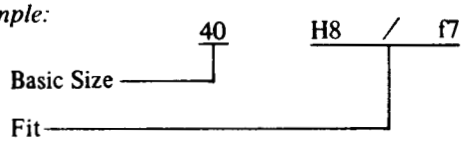
By combining the IT grade number and the tolerance position letter, the tolerance symbol is established which identifies the actual maximum and minimum limits of the part. The toleranced sizes is thus defined by the basic size of the part followed by a symbol composed of a letter and a number.

Examples:



A fit is indicated by the basic size common to both components, followed by a symbol corresponding to each component, the internal part symbol preceding the external part symbol.

Example:



Some methods of designating tolerances on drawings gages, etc. are shown in the following three examples.

a. 40H8 b. $40H8\begin{pmatrix}40.039\\40.000\end{pmatrix}$ c. $\begin{matrix}40.039\\40.000\end{matrix}$ (40H8)

Note: Values in parentheses indicate reference only.

5. PREFERRED BASIC SIZES

The basic size of mating parts should, where possible, be chosen from the first choice sizes listed in Table 1, which were selected from the preferred diameters of round metal products in the American National Standard for Preferred Metric Sizes for Round, Square and Hexagonal Metal Products, B32.4-1974. The preference rating has been based on the RENARD'S series of preferred numbers (see American National Standards on Preferred Numbers, Z17.1-1973) and the first choice sizes shown in Table 1 follow approximately the preferred number series R10, where succeeding numbers in the series increase by 25%. The second choice series shown are rounded off from the R20 series of preferred numbers (12% increments).

The first choice sizes can be rationalized by selecting every second number in the series such as 1, 1.6, 2.5, 4, 6, 10, 16, etc., and this number series is rounded off from the R5 series of preferred numbers (60% increments).

Preferred sizes outside the range of 1 through 1000 are found by multiplying or dividing the sizes shown in Table 1 by 1000 or multiples thereof.

Table 1 Preferred Sizes

Basic Size, mm		Basic Size, mm		Basic Size, mm	
First Choice	Second Choice	First Choice	Second Choice	First Choice	Second Choice
1		10		100	
	1.1		11		110
1.2		12		120	
	1.4		14		140
1.6		16		160	
	1.8		18		180
2		20		200	
	2.2		22		220
2.5		25		250	
	2.8		28		280
3		30		300	
	3.5		35		350
4		40		400	
	4.5		45		450
5		50		500	
	5.5		55		550
6		60		600	
	7		70		700
8		80		800	
	9		90		900
				1000	

6. PREFERRED TOLERANCE ZONES

The preferred tolerance zones are shown in Figure 2 for internal dimensions and in Figure 3 for external dimensions. The encircled tolerance zones (13 each) are first choice, the framed tolerance zones are second choice, and the open tolerance zones are third choice. The encircled tolerance zones are specified for all preferred fits in this standard.

Deviations from basic size for all tolerance zones in Figures 2 and 3 are tabulated in sizes over 0 to 500 mm in Appendix A.

Deviations from basic size for all tolerance zones not shown in Figure 2 and Figure 3 may be calculated from table values given in Appendix B for sizes up to 3150 mm.

7. PREFERRED FITS

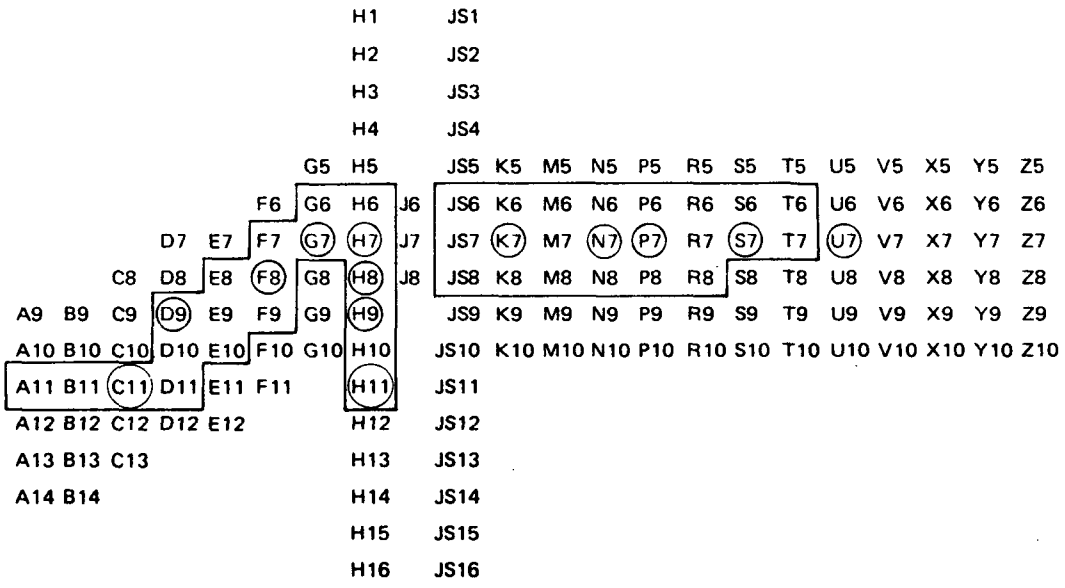
First choice tolerance zones are used to establish preferred fits in this standard, as shown to relative scale in Figure 4 for hole basis and in Figure 5 for shaft basis fits. Hole basis fits have a fundamental deviation of "H" on the hole, and shaft basis fits have a fundamental deviation of "h" on the shaft. A description of both types of fits which have the same relative fit condition is given in Figure 6. Normally, the hole basis system is preferred, however, when a common shaft mates with several holes, the shaft basis system should be used. Thus, clearance fit H7/h6 is included in both hole basis and shaft basis fits.

The hole basis and shaft basis fits of Figure 6 are combined with the first choice sizes of Table 1 to form Tables 2, 3, 4 and 5 where the specific limits as well as the resultant fits are tabulated.

If the required size is not tabulated in Tables 2, 3, 4 and 5, the preferred fit can be calculated from numerical values shown in Tables A1 through A24 in Appendix A.

It is anticipated that other fit conditions may be necessary to suit special requirements, and a preferred fit can be loosened or tightened simply by selecting a standard tolerance zone in Figure 2 or 3. Other fit conditions may be calculated from the numerical values for standard tolerance zones shown in Tables A1 through A24 in Appendix A.

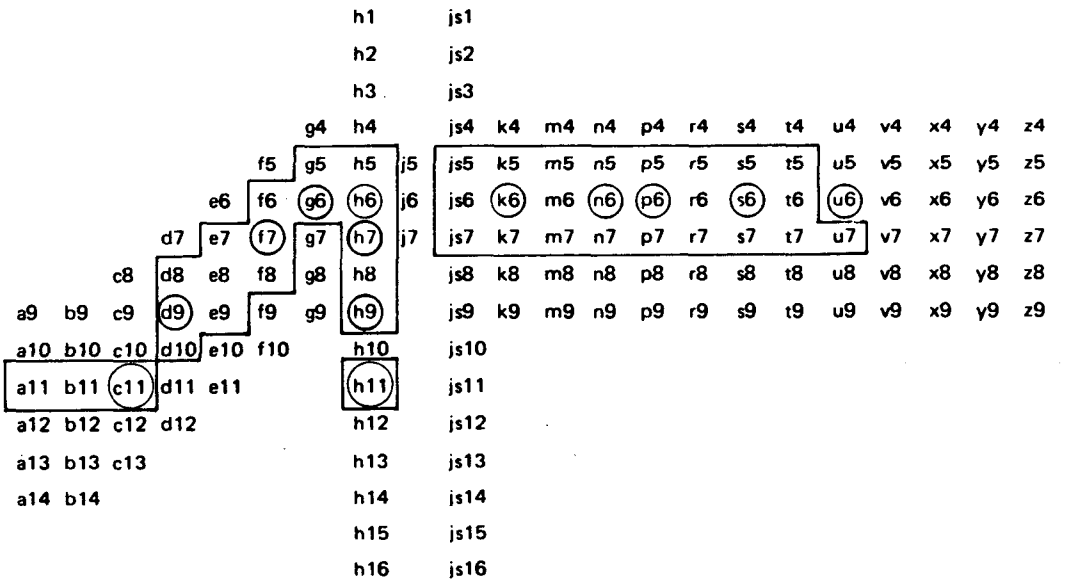
Information on how to calculate the limit dimensions, clearances, and interferences, for non-preferred fits and sizes can be found in Appendix A and Appendix B.



For numeric values of tolerance zones shown see Appendix A.

FIG. 2 TOLERANCE ZONES FOR INTERNAL DIMENSIONS (HOLES)

Legend: First choice tolerance zones encircled (ANSI B4.2 preferred)
Second choice tolerance zones framed (ISO 1829 selected)
Third choice tolerance zones open



For numeric values of tolerance zones shown see Appendix A.

FIG. 3 TOLERANCE ZONES FOR EXTERNAL DIMENSIONS (SHAFTS)

Legend: First choice tolerance zones encircled (ANSI B4.2 preferred)
Second choice tolerance zones framed (ISO 1829 selected)
Third choice tolerance zones open

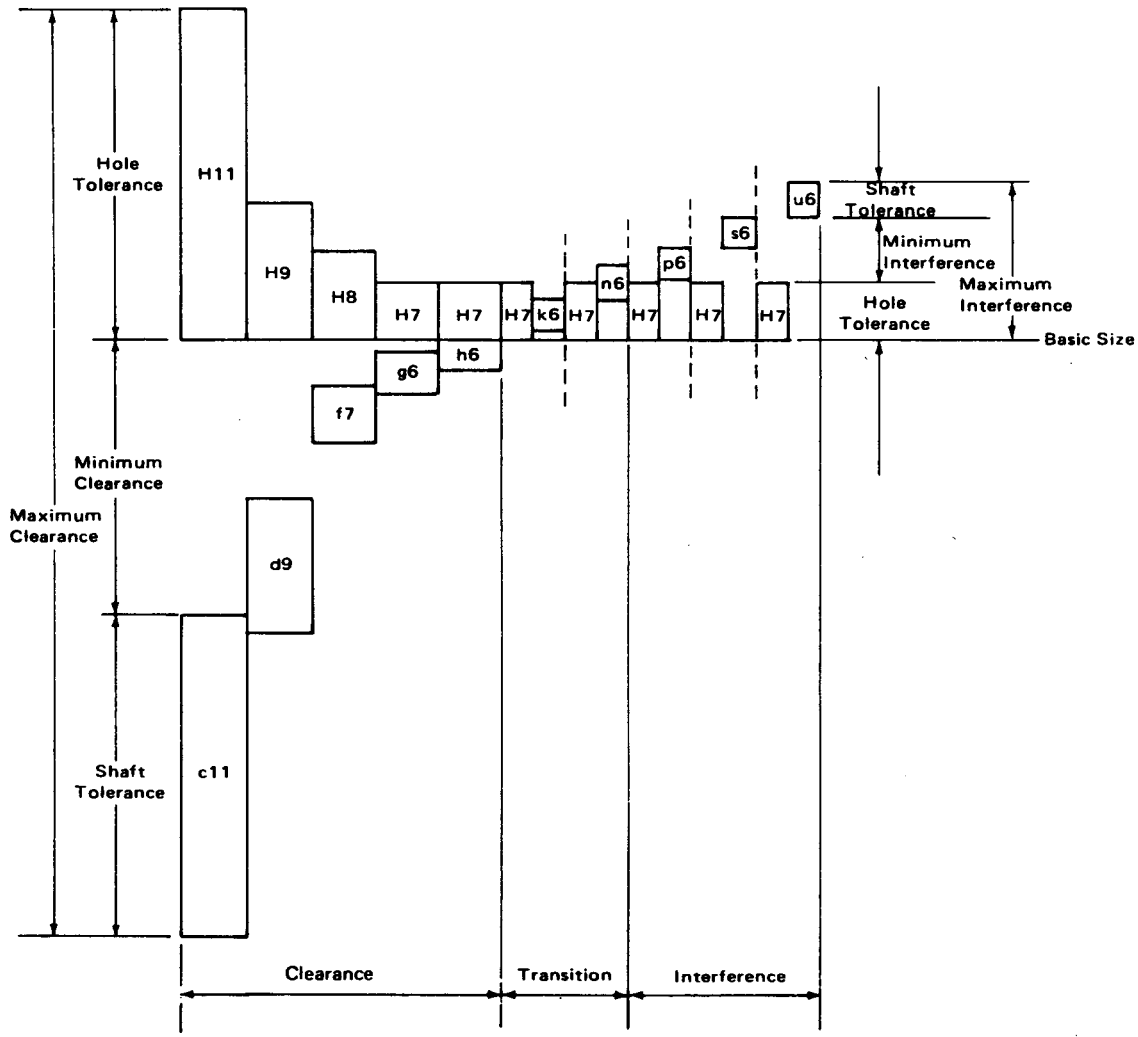


FIG. 4 PREFERRED HOLE BASIS FITS

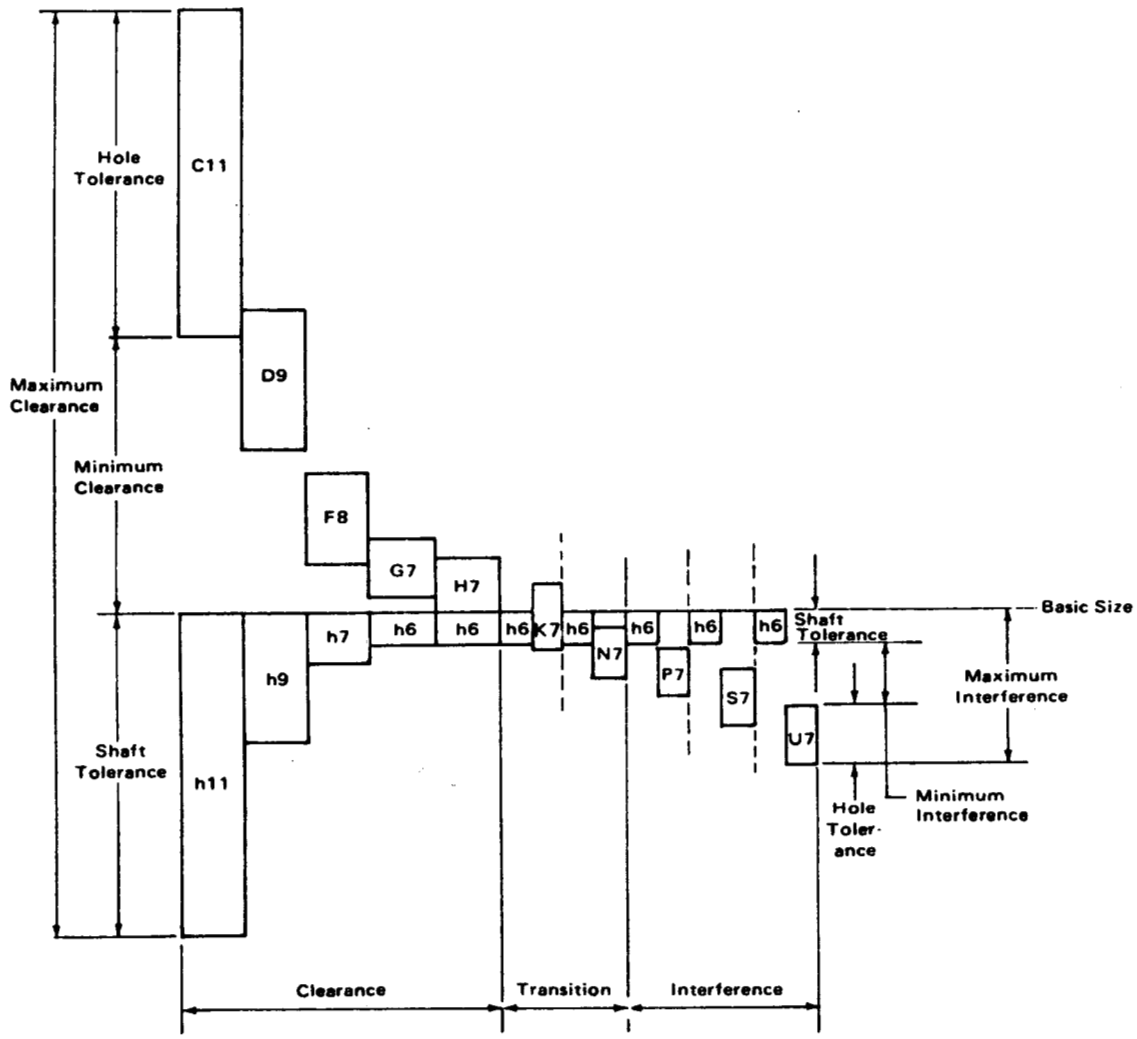

FIG. 5 PREFERRED SHAFT BASIS FITS

	ISO SYMBOL		DESCRIPTION
	Hole Basis	Shaft[1] Basis	
Clearance Fits	H11/c11	C11/h11	*Loose running* fit for wide commercial tolerances or allowances on external members.
	H9/d9	D9/h9	*Free running* fit not for use where accuracy is essential, but good for large temperature variations, high running speeds, or heavy journal pressures.
	H8/f7	F8/h7	*Close running* fit for running on accurate machines and for accurate location at moderate speeds and journal pressures.
	H7/g6	G7/h6	*Sliding* fit not intended to run freely, but to move and turn freely and locate accurately.
Transition Fits	H7/h6	H7/h6	*Locational clearance* fit provides snug fit for locating stationary parts; but can be freely assembled and disassembled.
	H7/k6	K7/h6	*Locational transition* fit for accurate location, a compromise between clearance and interference.
	H7/n6	N7/h6	*Locational transition* fit for more accurate location where greater interference is permissible.
Interference Fits	H7/p6	P7/h6	*Locational interference* fit for parts requiring rigidity and alignment with prime accuracy of location but without special bore pressure requirements.
	H7/s6	S7/h6	*Medium drive* fit for ordinary steel parts or shrink fits on light sections, the tightest fit usable with cast iron.
	H7/u6	U7/h6	*Force* fit suitable for parts which can be highly stressed or for shrink fits where the heavy pressing forces required are impractical.

More Clearance — More Interference

[1] The transition and interference shaft basis fits shown do not convert to exactly the same hole basis fit conditions for basic sizes in range from 0 through 3 mm. Interference fit P7/h6 converts to a transition fit H7/p6 in the above size range.

APPENDIX B

TABLE OF INTERNATIONAL TOLERANCE GRADES, FUNDAMENTAL DEVIATIONS AND THEIR DERIVATIONS

CONTENTS

TABLE

APPENDIX B

B1. INTRODUCTION

This appendix provides the data needed to calculate limit dimensions for nonpreferred tolerance designations (that is those not shown in Figures 2 and 3 of this standard) and for basic sizes larger than 500 millimeters. This appendix contains:

a. *International tolerance grades from IT01 thru IT16* for basic sizes up to and including 3150 millimeters (Table B1). Tolerance zones with IT grades larger than IT16 are sometimes used. A footnote in Table B1 gives a simple formula for calculating IT17, IT18, etc.

b. *Fundamental deviations* for basic sizes up to 3150 millimeters:

Holes	Table B2
Shafts	Table B3

c. *Interpretation of ISO symbols* using the table values for basic sizes up to 3150 millimeters (paragraph B2).

d. *Formulas for the derivation of table values.* These formulas are for reference only. Rounding variations introduced in calculations may result in values which are inconsistent with the published national and international standards (paragraph B3).

e. *Guidelines for converting fits* (paragraph B4).

[3] IT Values for tolerance grades larger than IT16 can be calculated by using the following formulas:
IT 17 = IT12 x 10; IT18 = IT13 x 10; etc.

[5] Special case: for M6, upper deviation = − 0.009 from 250 to 315 (instead of − 0.011).

[4] In determining K, M, N up to IT grade 8 and P to ZC up to IT grade 7, add the Δ value appropriate to the IT grade as indicated, for example for P7 from 18 to 30, Δ = 0.008 ∴ upper deviation = −0.014.

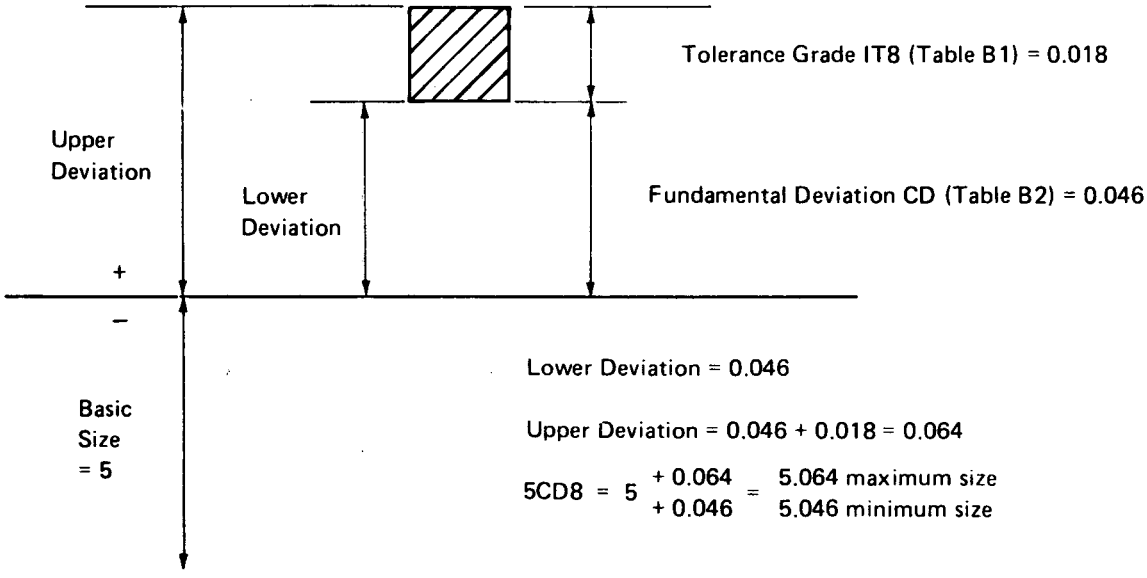
B2. INTERPRETATION OF ISO SYMBOLS USING TABLE VALUES

B2.1 HOLE LETTER CODES A THRU JS

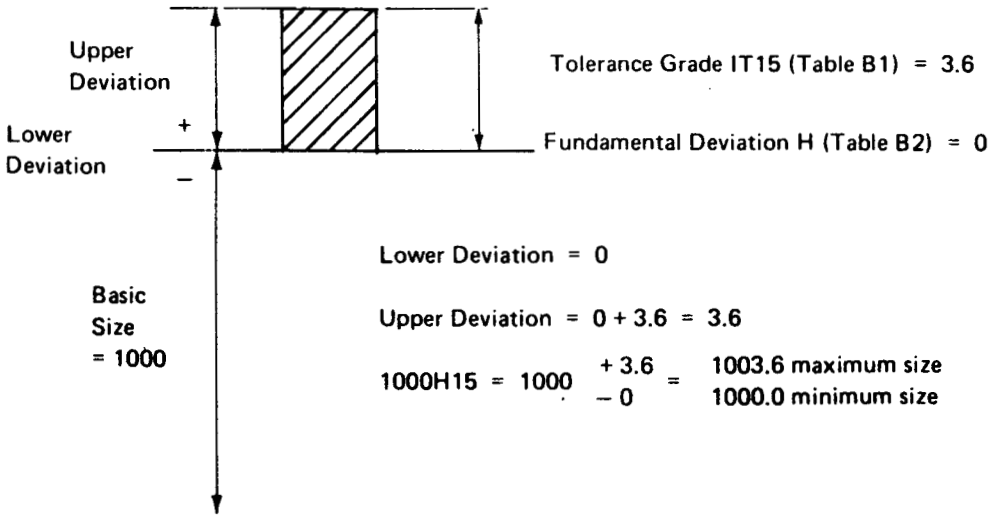
The fundamental deviation equals the lower deviation, and the following equation is valid.

Upper Deviation = Lower Deviation + Tolerance Grade

EXAMPLE 1. INTERNAL (HOLE) DIMENSION 5CD8



EXAMPLE 2. INTERNAL (HOLE) DIMENSION 1000H15

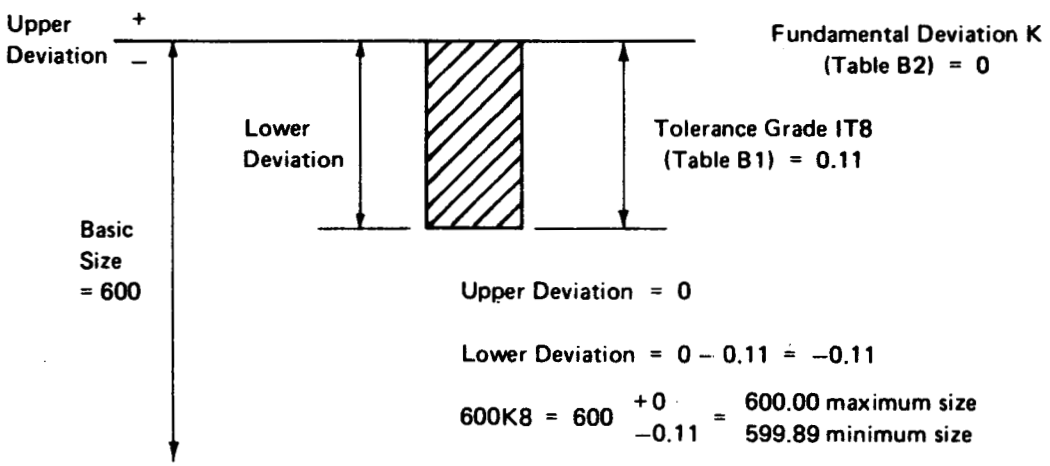


B2.2 HOLE LETTER CODES J THRU ZC

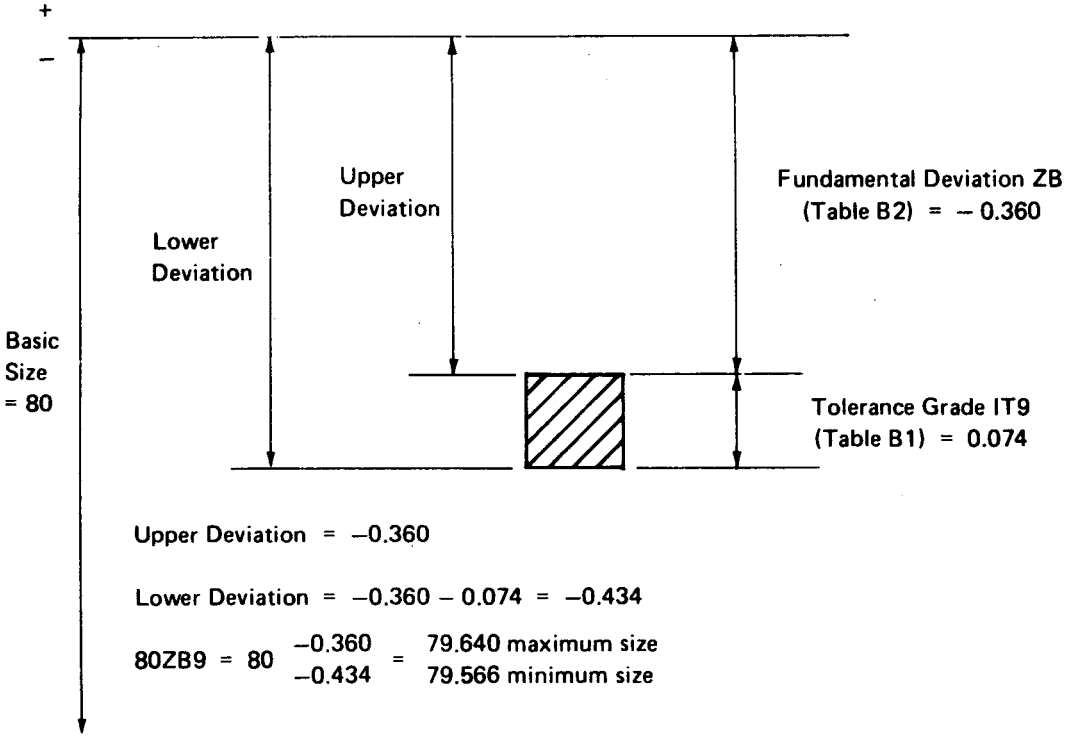
The fundamental deviation equals the upper deviation and the following equation is valid.

$$\text{Lower Deviation} = \text{Upper Deviation} - \text{Tolerance Grade}$$

EXAMPLE 3. INTERNAL (HOLE) DIMENSION 600K8



EXAMPLE 4. INTERNAL (HOLE) DIMENSION 80ZB9



Upper Deviation = –0.360

Lower Deviation = –0.360 – 0.074 = –0.434

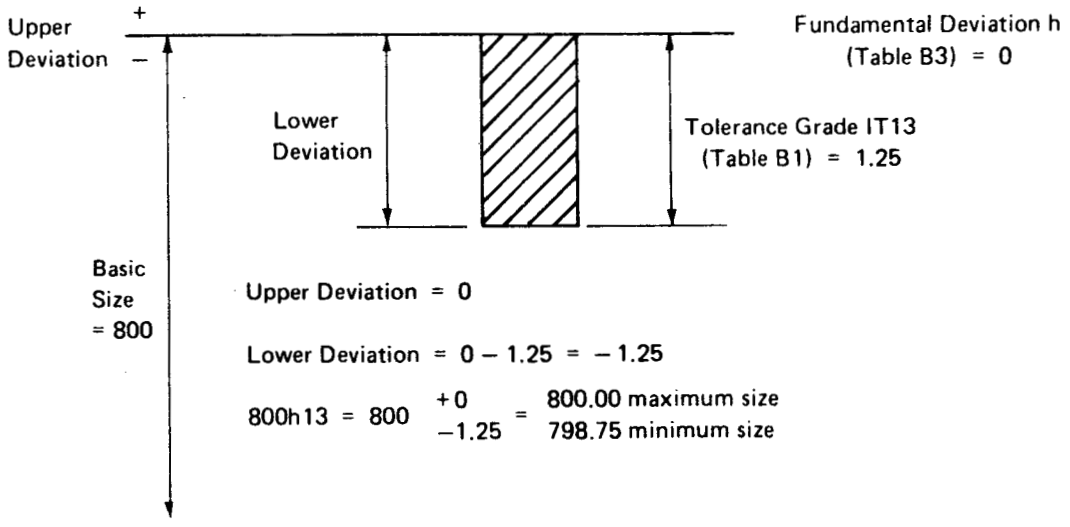
$$80ZB9 = 80\ ^{-0.360}_{-0.434} = \begin{matrix} 79.640 \text{ maximum size} \\ 79.566 \text{ minimum size} \end{matrix}$$

B2.3 SHAFT LETTER CODES a THRU js

Fundamental deviation equals upper deviation and the following equation is valid.

Lower Deviation = Upper Deviation – Tolerance Grade

EXAMPLE 5. EXTERNAL (SHAFT) DIMENSION 800h13

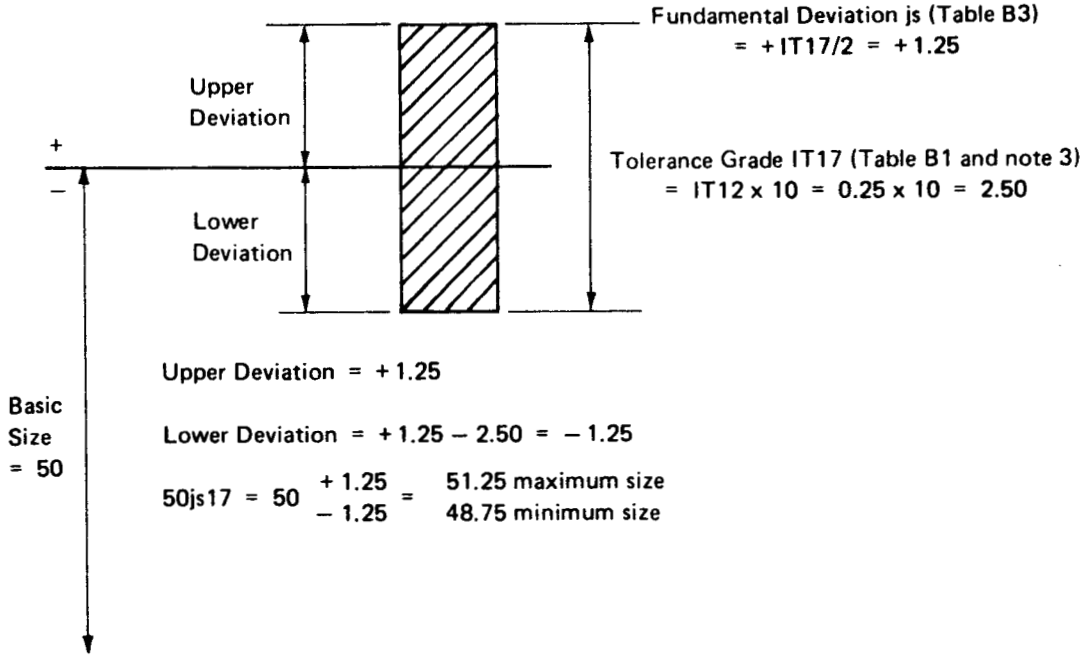


Upper Deviation = 0

Lower Deviation = 0 – 1.25 = – 1.25

$800h13 = 800\ ^{+0}_{-1.25} =$ 800.00 maximum size, 798.75 minimum size

EXAMPLE 6. EXTERNAL (SHAFT) DIMENSION 50js17[8]



Upper Deviation = +1.25

Lower Deviation = +1.25 – 2.50 = – 1.25

$50js17 = 50\ ^{+1.25}_{-1.25} =$ 51.25 maximum size, 48.75 minimum size

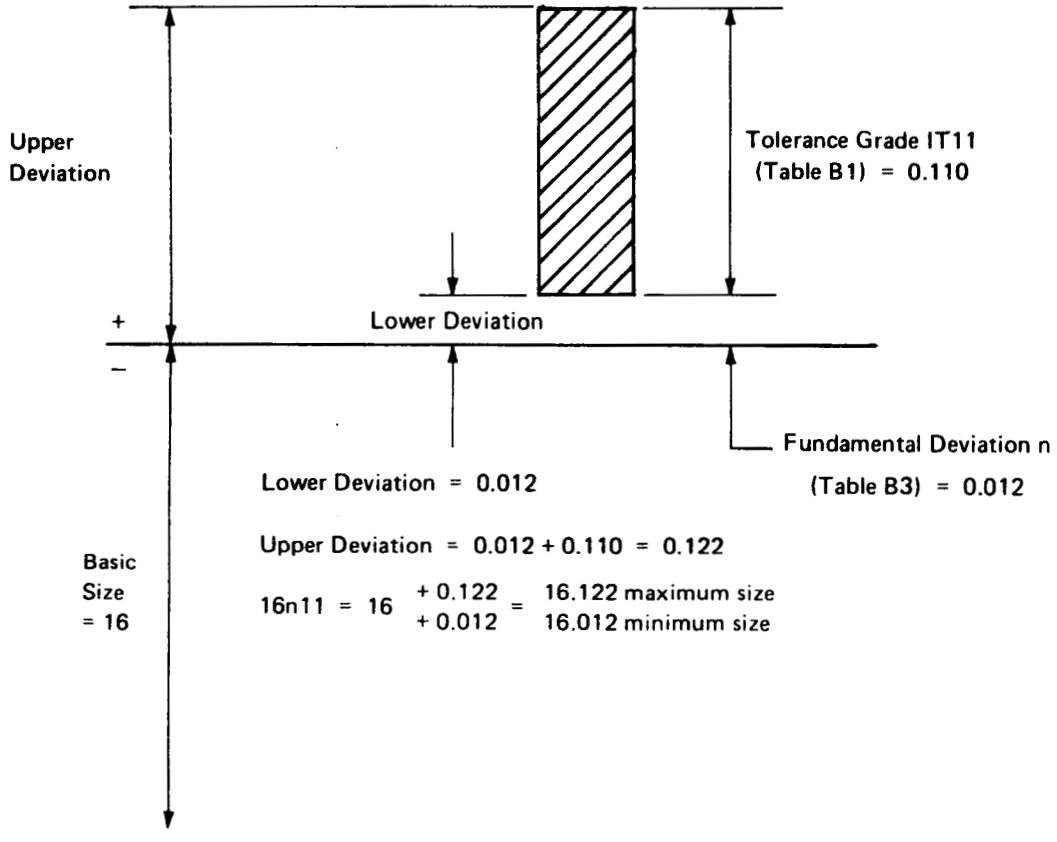
[8] IT grades larger than IT16 are sometimes used.

B2.4 SHAFT LETTER CODES j THRU zc

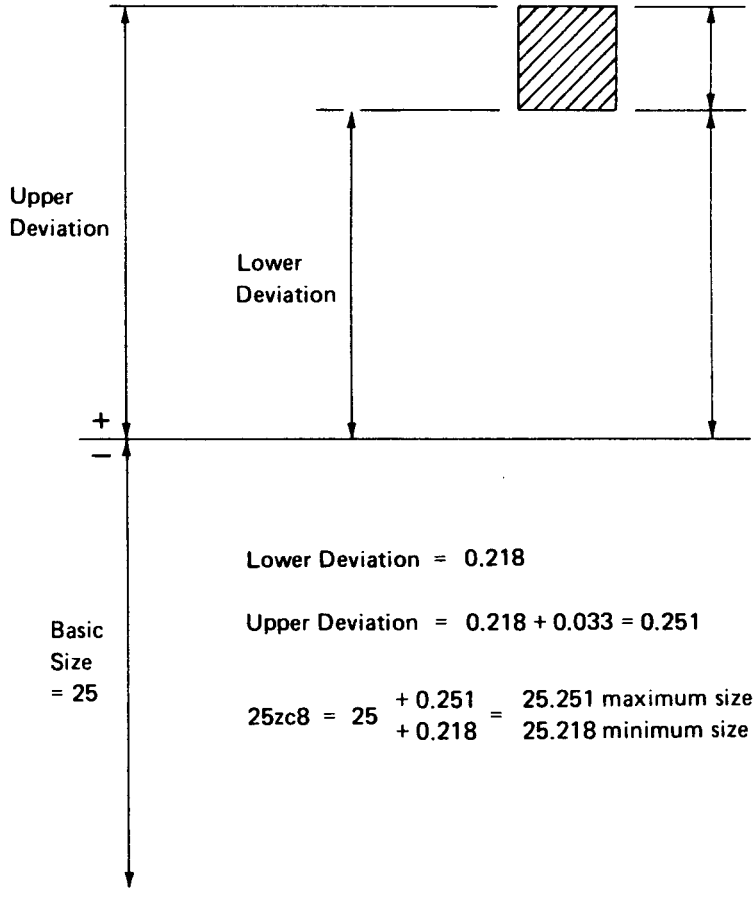
The fundamental deviation equals the lower deviation and the following equation is valid.

Upper Deviation = Lower Deviation + Tolerance Grade

EXAMPLE 7. EXTERNAL (SHAFT) DIMENSION 16n11



EXAMPLE 8. EXTERNAL (SHAFT) DIMENSION 25zc8



Lower Deviation = 0.218

Upper Deviation = 0.218 + 0.033 = 0.251

$$25zc8 = 25 \begin{matrix} +0.251 \\ +0.218 \end{matrix} = \begin{matrix} 25.251 \text{ maximum size} \\ 25.218 \text{ minimum size} \end{matrix}$$

B3 DERIVATION OF TABLE VALUES

This section explains how the numerical values shown in Tables B1, B2 and B3 were derived.

B3.1 INTERNATIONAL TOLERANCE GRADES (IT)

Table B1 of International Tolerance Grades lists values based on former national standards. Formulas have been empirically determined to meet these values. Eighteen International Tolerance Grades are provided in this standard, and are designated IT01, IT0 and IT1 through IT16. The lower numerical grade number, the more precision or closer tolerance of manufacture is required. The numerical values of these tolerance grades are given in Table B1.

Determination of the steps of the more commonly used grades of IT6 through IT16 is based on the Renard R5 geometric series as shown in Table B4.

TABLE B4 Formulas for IT Grades 6 Through 16[9]

IT6	10i*	IT11	100i	IT16	1000i
IT7	16i	IT12	160i		
IT8	25i	IT13	250i		
IT9	40i	IT14	400i		
IT10	64i	IT15	640i		

$$* i = \frac{0.45\sqrt[3]{D} + 0.001D}{1000}$$

where i and D are in millimeters. The diameter D is considered as the geometrical mean of the maximum and minimum diameters of each step $D = \sqrt{(\text{maximum diameter}) \times (\text{minimum diameter})}$. For the whole of the step up to 3 millimeters, the diameter is considered as the geometrical mean of 1 and 3 mm.

Grades IT01 through IT5 are used for high precision and are calculated by a different method as shown in Table B5.

TABLE B5 Formulas for IT Grades 01 Through 5[9]

IT01	$\frac{(0.3 + 0.008D)}{1000}$
IT0	$\frac{(0.5 + 0.012D)}{1000}$
IT1	$\frac{(0.8 + 0.02D)}{1000}$
IT2	$(IT1)\left(\frac{7i}{IT1}\right)^{1/4}$
IT3	$(IT1)\left(\frac{7i}{IT1}\right)^{1/2}$
IT4	$(IT1)\left(\frac{7i}{IT1}\right)^{3/4}$
IT5	$7i$

[9] Formulas for reference only. Table B1 values must be used to conform with accepted international tolerance grade values.

B3.2 DERIVATION OF FUNDAMENTAL DEVIATIONS FOR SHAFTS

The fundamental deviation has been previously defined as that one of two deviations closest to the basic size. Table B3 lists these values for shafts. This table has been developed based on experimental data and cannot in every case be totally calculated. Formulas have been derived, however, from the table values to fit most cases. The general formula is as follows:

$$\text{Fundamental Deviation} = \alpha + \frac{\beta D^{\gamma}}{1000}$$

where α, β, and γ are determined from Table B6 and D represents the geometric mean diameter of the particular step in millimeters. As noted in the table there are several exceptions to the general formula.

The fundamental deviation for shafts designated "a" through "h" is the upper deviation. The lower deviation is found by subtracting the numerical value of the IT grade from the fundamental deviation. The fundamental deviation for shafts designated "j" through "zc" is the lower deviation. The upper deviation is found by adding the numerical value of the IT grade to the fundamental deviation.

TABLE B6 COEFFICIENTS FOR THE CALCULATION OF FUNDAMENTAL DEVIATIONS FOR SHAFTS[10]

FUNDAMENTAL DEVIATION $= \alpha + \frac{\beta D^{\gamma}}{1000}$ Where D = Geometric Mean Diameter of Diameter Step

FUNDAMENTAL DEVIATION	α	β	γ	NOTES
a	−0.265 0	−1.3 −3.5	1 1	$D \leq 120$ $D > 120$
b	−0.140 0	−0.85 −1.8	1 1	$D \leq 160$ $D > 160$
c	0 −0.095	−5.2 −0.8	0.2 1	$D < 40$ $D > 40$
cd	–	–	–	
d	0	−16	0.44	$cd = \sqrt{c \cdot d}$
e	0	−11	0.41	
ef	–	–	–	$ef = \sqrt{e \cdot f}$
f	0	−5.5	0.41	
fg	–	–	–	$fg = \sqrt{f \cdot g}$
g	0	−2.5	0.34	
h	0	0	0	
j	–	–	–	No formula
js	–	–	–	$js = \frac{IT^{11}}{2}$
k	0 0	0.6 0	0.33 0	IT4–IT7* $D \leq 500$ IT8–IT16* $D > 500$
m	$\frac{IT7^{11}}{1000}$ 0.013	$-IT6^{11}$ 0.024	0 1	$D \leq 500$ $D > 500$
n	0 0.021	5 0.04	0.34 1	$D \leq 500$ $D > 500$
p	$IT7^{11}$ 0.038	2 0.072	0 D	$D \leq 500$ $D > 500$
r	–	–	–	$r = \sqrt{p \cdot s}$
s	$IT8^{11}$ $IT7^{11}$	2 0.4	0 1	$D \leq 50$ $D > 50$
t	$IT7^{11}$	0.63	1	
u	$IT7^{11}$	1	1	
v	$IT7^{11}$	1.25	1	
x	$IT7^{11}$	1.6	1	
y	$IT7^{11}$	2	1	
z	$IT7^{11}$	2.5	1	
za	$IT8^{11}$	3.15	1	
zb	$IT9^{11}$	4	1	
zc	$IT10^{11}$	5	1	

[10] Formulas for reference only. Table B3 values must be used to conform with accepted international fundamental deviation values.

[11] Use the Numerical Value for this Interntional Tolerance Grade.

B3.3 DERIVATION OF FUNDAMENTAL DEVIATIONS FOR HOLES

The fundamental deviations for holes are based on the fundamental deviations for shafts. The relationship varies with both fundamental deviation letter and IT grade. The general rule for determining the fundamental deviation of a hole is as follows:

For fundamental deviations *A* through *H*, the lower deviation for holes equal minus the upper deviation for shafts and for fundamental deviations *J* through *ZC* the upper deviation for holes equals minus the lower deviation for shafts. This is shown pictorially in Figure B1.

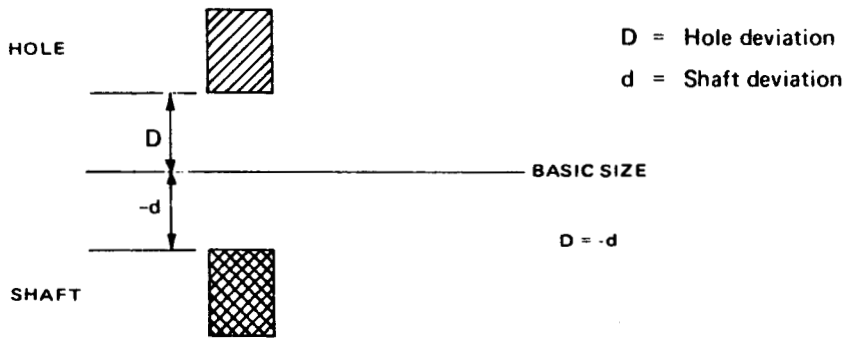


FIG. B1 GENERAL RULE

There are several exceptions to the general rule. The reasons for these exceptions must be maintained in order to keep the tables consistent with ISO standards. The exceptions to the general rule are as follows:

1. For holes *N* for IT grades 9 through 16 above 3 mm, the fundamental deviation = 0.000
2. For holes *J*, *K*, *M* and *N* up to IT grade 8 inclusive and *P* through *ZC* up to IT grade 7 inclusive above 3 mm, the fundamental deviation is calculated as follows: The upper deviation of the hole equals minus the lower deviation of the shaft plus the difference between the tolerance of the grade in question and that of the next finer grade.

$$\text{Upper Deviation (hole)} = -\text{lower deviation (shaft)} + \Delta$$

$$\text{Where } \Delta = IT_n - IT_{n-1}$$
$$= \text{IT (shaft)} - \text{IT (next finer shaft)}$$

Using a hole 60 P7 as an example, the calculation is as follows:

$-0.032 + (0.030 - 0.019) = -0.021$ or 59.979 (Max. hole size)
(Table B3) + (Table B1 grade 7 – grade 6) = (Table B2) (Table 5)

B4. CONVERSION OF FITS

It may sometimes be necessary or desirable to modify the tolerance zone on one or both of two mating parts, yet still keep the *total* tolerance and fit condition the same. Examples of this appear in Figure 6 of ANSI B4.2 when converting from a hole basis fit to a shaft basis fit. The corresponding fits are identical yet the individual tolerance zones are different.

The rule for converting from one type of fit to another can be simply stated as, "Reverse the fundamental deviations between the shaft and hole keeping the IT grade the same on each individual part." Two examples of this are shown below. Each of the examples represent a preferred fit from Figure 6 of ANSI B4.2 and are for a 60 millimeter basic size.

EXAMPLE 9. FIT 60H11/c11 CONVERTED TO 60C11/h11

Initial hole basis *loose running* fit, designation 60H11/c11 (values shown from Table 2).

Hole 60H11 $\begin{pmatrix}60.190\\60.000\end{pmatrix}$; Shaft 60c11 $\begin{pmatrix}59.860\\59.670\end{pmatrix}$; Fit 60H11/c11 $\begin{pmatrix}0.520\\0.140\end{pmatrix}$

Desired shaft basis *loose running* fit, designation 60C11/h11 (values shown from Table 4).

Hole 60C11 $\begin{pmatrix}60.330\\60.140\end{pmatrix}$; Shaft 60h11 $\begin{pmatrix}60.000\\59.810\end{pmatrix}$; Fit 60C11/h11 $\begin{pmatrix}0.520\\0.140\end{pmatrix}$

The above two fits have the same maximum clearance (0.520) and the minimum clearance (0.140). Pictorially this is shown in Figure B2.

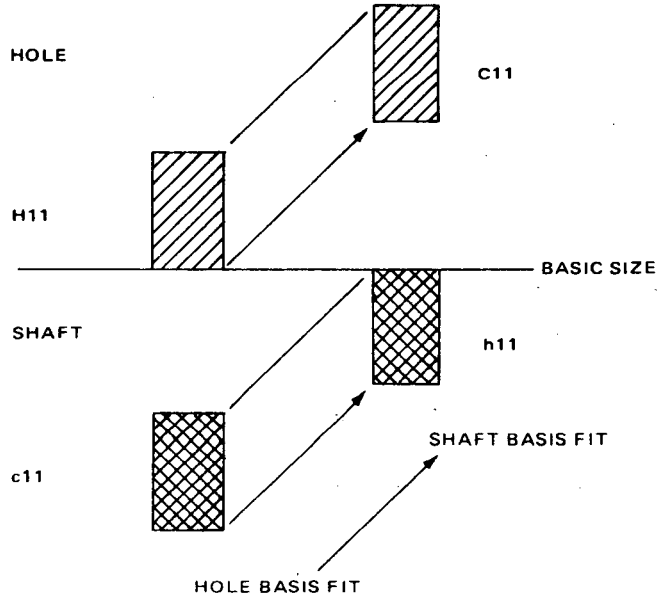

FIG. B2 CONVERSION FROM A HOLE BASIS CLEARANCE FIT TO A SHAFT BASIS CLEARANCE FIT

EXAMPLE 10. FIT 60H7/p6 CONVERTED TO 60P7/h6

Initial hole basis *locational interference* fit, designation 60H7/p6 (values shown from Table 3).

$$\text{Hole 60H7} \begin{pmatrix} 60.030 \\ 60.000 \end{pmatrix}; \qquad \text{Shaft 60p6} \begin{pmatrix} 60.051 \\ 60.032 \end{pmatrix}; \qquad \text{Fit 60H7/p6} \begin{pmatrix} -0.002 \\ -0.051 \end{pmatrix}$$

Desired shaft basis *locational interference* fit, designation 60P7/h6 (values shown from Table 5).

$$\text{Hole 60P7} \begin{pmatrix} 59.979 \\ 59.949 \end{pmatrix}; \qquad \text{Shaft 60h6} \begin{pmatrix} 60.000 \\ 59.981 \end{pmatrix}; \qquad \text{Fit 60P7/h6} \begin{pmatrix} -0.002 \\ -0.051 \end{pmatrix}$$

The above two fits have the same minimum interference (–0.002) and the maximum interference (–0.051). Pictorially, this is shown in Figure B3.

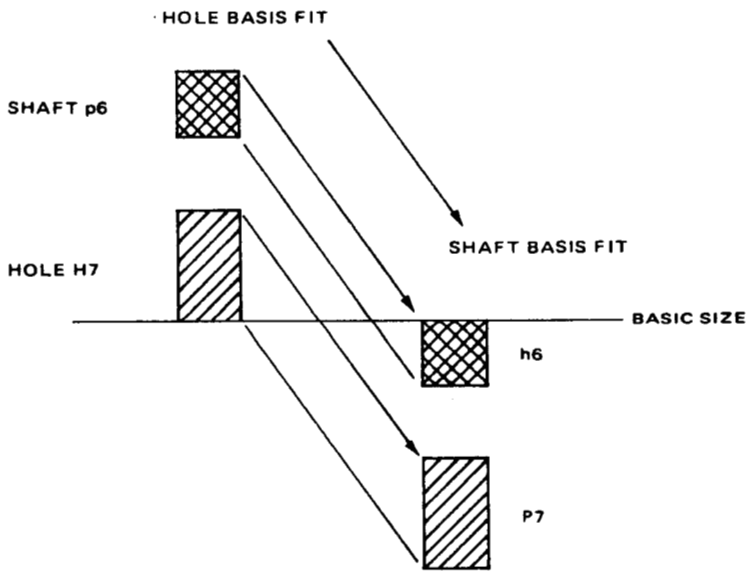

FIGURE B3 CONVERSION FROM A HOLE BASIS INTERFERENCE FIT TO A SHAFT BASIS INTERFERENCE FIT

Conversion of fits is not limited to shaft and hole basis fits as the following examples show:

clearance fit	C10/f10	=	F10/c10
interference fit	P9/t9	=	T9/p9
clearance fit	D7/f6	=	F7/d6
interference fit	S7/u6	=	U7/s6
transition fit	K8/n7	=	N8/k7

The above examples can be confirmed by calculations using Tables A1 through A24.

APPENDIX C

APPLICATIONS

Many factors, such as length of engagement, bearing load, speed, lubrication, operating temperature, humidity, surface texture, and materials, must be taken into consideration in the selection of fits for a particular application. Choice of other than the preferred fits might be considered necessary to satisfy extreme conditions. Subsequent adjustments might also be desired as the result of experience in a particular application to suit critical functional requirements or to permit optimum manufacturing economy. Selection of departure from these recommendations will depend upon consideration of the engineering and economic factors that might be involved, however, the benefits derived from use of preferred fits should not be overlooked.

To indicate the machining processes which may normally be expected to produce work within the tolerances indicated by the IT tolerance grades given in this standard, Figure C1 has been provided. This information is intended merely as a guide in selecting suitable processes for a particular IT tolerance grade.

Practical usage of the various IT tolerance grades is shown in Figure C2.

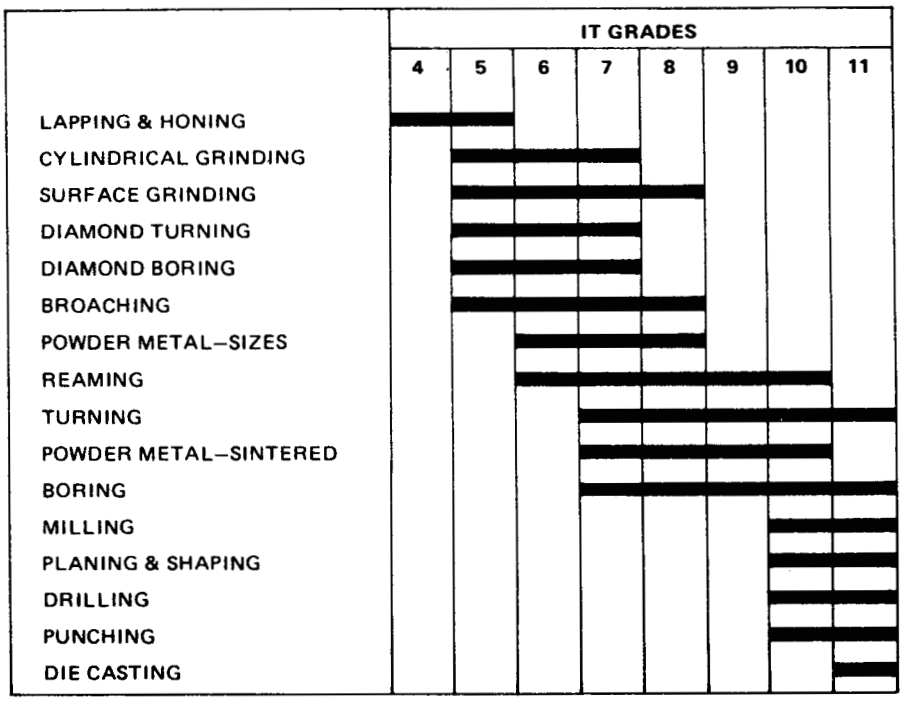

FIG. C1 MACHINING PROCESSES

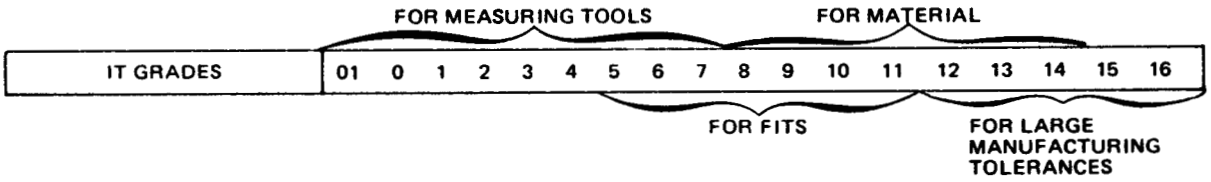

FIG. C2 PRACTICAL USE OF INTERNATIONAL TOLERANCE GRADES

APPENDIX D

REFERENCE TEMPERATURE

The standard reference temperature for industrial length measurements is 20 degrees Celsius.

For other temperatures, particularly when the gage is made from another type of material than the part to be inspected corrections should be made in accordance with the difference in thermal expansion[12] for the two parts.

Example: Measure a hole in an aluminum die casting with a steel gage at the room temperature 30 °C.

Temperature correction	Δ	
Length specified	L	= 20.021 mm
Room temperature	t	= 30 °C
Reference temperature	t_R	= 20 °C

Linear thermal expansion coefficient for parts made from the material SAE 452 Grade 310

$$\alpha_{Part} = 24.7 \times 10^{-6} \text{ mm/mm} \cdot {}^{\circ}\text{C}$$

Linear thermal expansion coefficient for gages made from 1.08% carbon steel

$$\alpha_{Gage} = 10.8 \times 10^{-6} \text{ mm/mm} \cdot {}^{\circ}\text{C}$$

$$\begin{aligned}\Delta &= L\,(t - t_R)\,(\alpha_{Part} - \alpha_{Gage}) \\ &= 20.021\,(30 - 20)\,(24.7 - 10.8)\,10^{-6} \text{ mm} \\ &= 2782.919\,10^{-6} \text{ mm} \\ &\approx 0.003 \text{ mm}\end{aligned}$$

The dimension to read on the gage for hole measurement is temperature corrected to 20.024 mm.

[12] Linear thermal expansion coefficients for metals and alloys are shown in the "Materials Handbook" published by American Society for Metals, Metals Park, Ohio 44073.
